Factory price bus tie breaker in Puerto-Rico

Overview

What is a bus tie breaker?

In electrical distribution systems, a bus tie breaker is used to connect two sections of an electrical bus serving different power sources. Bus tie breakers are usually open, keeping the two sections separate. When one power source fails, the tie breaker can be closed to maintain service through the section, avoiding a planned service outage.

What is a tie breaker?

A tie breaker is a type of circuit breaker that connects two sections of an electrical bus serving different power sources. They are commonly used to connect electrical systems to power sources and load circuits, as well as to protect people and equipment from overcurrents.

How many bus tie breaker controllers can a Deif power management system include?

A DEIF power management system can include as many Bus tie breaker controllers as necessary. Part of the versatile PPM 300 range The PPM 300 Bus tie breaker controller is part of the DEIF PPM 300 range of versatile controllers with built-in multi-master power management features.

What is a PPM 300 bus tie breaker controller?

The PPM 300 Bus tie breaker controller is designed for controlling a single bus tie breaker and supports ring busbar connections.

How does a bus circuit breaker work?

When a fault occurs on a bus, the bus section circuit breaker is opened, separating the bus into two sections. This isolation limits the impact of the fault, ensuring that only a portion of the loads loses power while allowing for continued operation of the unaffected sections.

Why should a tie breaker be separated when not in use?

Keeping the two sections separated when not in use is important for several reasons. Firstly, it allows for redundancy in the system. If one power source fails, the tie breaker can be closed to bring in the second power source to supply the entire load. This ensures that there is no disruption to the critical load.
