# Installation method of outdoor wiring rack for base station

## Overview

---

How should a base station antenna be installed?

The hardware installation guidelines are limited but important for reliable base station performance. The base station antenna should be installed in open sky conditions, away from external influences that hinder the direct line of sight between the antenna and the GNSS satellites.

Where should an antenna be installed?

In general, this means that the ideal antenna installation is near the centre of the work area. For larger work areas (several 10's of km's), it is advised to place several base stations for optimal performance and easy selection of the nearest base station.

What is the National Electrical Code (NEC) for outdoor wiring?

The National Electrical Code (NEC) includes many specific requirements for installation of outdoor circuits and equipment. With outdoor wiring, the primary safety concerns involve shielding against moisture and corrosion, preventing physical damage, and managing issues related to underground burial.

Do I need a lightning arrestor to install an antenna?

For permanent installations, use of a lightning arrestor is recommended. The choice of antenna cable is also important when installing an antenna, particularly for permanent installations. For longer cable runs (>20 meters), the use of low-loss cables is highly recommended.

Where is the antenna set up?

Depending on how the reference position is determined (which is explained in the next article in this series), the antenna may be set up on top of a point for which the coordinates are known, such as a geodetic control point.

How high should a data transmission wire be in a pool?

Data transmission wires (telephone, internet, etc.) must be at least 10 feet above the surface of the water in pools, spas, and hot tubs. This is not an NEC requirement, but it could save your life, not to mention prevent considerable trouble with your service providers.
